

RoleSelectButton – Full UI Code & Documentation

Overview

`RoleSelectButton` is a reusable Flutter UI widget that works like a **segmented control**. It displays multiple options horizontally and allows selecting **one role at a time**.

This document contains: -  **Full UI code (not removed or shortened)** -  Clear explanation of each part
-  Example usage -  Customization notes

Full UI Code (Complete & Original)

```
import 'package:flutter/material.dart';
import 'package:flutter_screenutil/flutter_screenutil.dart';
import 'package:temurjon/gen/colors.gen.dart';
import 'package:temurjon/constants/text_font_style.dart';

class RoleSelectButton extends StatelessWidget {
  final int selectedIndex;
  final Function(int) onChanged;
  final List<String> items; // List of button labels

  const RoleSelectButton({
    super.key,
    required this.selectedIndex,
    required this.onChanged,
    required this.items,
  });

  @override
  Widget build(BuildContext context) {
    return Container(
      width: 190.w * items.length, // adjust width based on item count
      padding: EdgeInsets.all(6.r),
      height: 41.h,
      decoration: BoxDecoration(
        color: AppColors.c73010B,
        borderRadius: BorderRadius.circular(16.r),
      ),
      child: Row(
        children: List.generate(items.length, (index) {
          final isSelected = selectedIndex == index;
```

```

return Expanded(
  child: GestureDetector(
    onTap: () => onChanged(index),
    child: Container(
      decoration: BoxDecoration(
        color: isSelected
          ? AppColors.cF8F3DD
          : AppColors.c73010B,
        borderRadius: BorderRadius.circular(10.r),
      ),
      child: Center(
        child: Text(
          items[index],
          textAlign: TextAlign.center,
          style: isSelected
            ? TextStyle
              .textStyle16c73010BEurostileW400
            : TextStyle
              .textStyle16c73010BEurostileW400
              .copyWith(color: Colors.white),
        ),
      ),
    ),
  ),
);
}),
),
);
}
}
}

```

Example Usage (Parent Widget)

```

int selectedIndex = 0;

RoleSelectButton(
  selectedIndex: selectedIndex,
  onChanged: (value) {
    setState(() {
      selectedIndex = value;
    });
  },
  items: ['Personal', 'Vehicle', 'Work', 'Other'],
)

```

Explanation (Line by Line)

1. Constructor Parameters

Parameter	Type	Purpose
<code>selectedIndex</code>	<code>int</code>	Holds the currently selected button index
<code>onChanged</code>	<code>Function(int)</code>	Callback when a button is tapped
<code>items</code>	<code>List<String></code>	Button labels (dynamic count)

2. Responsive Layout

- `flutter_screenutil` is used for:
- Width (`190.w`)
- Height (`41.h`)
- Padding & radius (`.r`)

This ensures proper scaling on all screen sizes.

3. Selection Logic

```
final isSelected = selectedIndex == index;
```

- Checks which button is active
- Changes background and text color accordingly

4. Gesture Handling

```
GestureDetector(  
  onTap: () => onChanged(index),  
)
```

- Sends the tapped index to parent widget
- Parent updates state using `setState`

5. UI Styling

- **Selected Button**

- Light background (`cF8F3DD`)

- Dark text

- **Unselected Button**

- Dark background (`c73010B`)

- White text

Customization Guide

You can easily modify:

- Button height & width
 - Border radius
 - Colors (`AppColors`)
 - Text style (`TextFontStyle`)
 - Number of buttons (just change `items` list)
-

Best Practices

- Manage `selectedIndex` in a `StatefulWidget`
 - Keep `items` text short
 - Use meaningful labels for better UX
-

Summary

`RoleSelectButton` is a clean, responsive, and reusable segmented-button widget. It keeps UI logic separate from state management and supports dynamic button counts.

This document is **fully editable** and safe to reuse for team review or future updates.
