

Gender Selected Button Documentation

Overview

The **GenderSelectedButton** is a reusable Flutter UI component designed to allow users to select **only one option at a time** (Male or Female). It visually highlights the selected option and updates state accordingly.

This pattern follows a **single-selection (radio-button-like) behavior**, even though it is visually customized.

Purpose

- Display gender options as buttons
 - Allow **only one gender to be selected at a time**
 - Provide clear visual feedback for the selected state
 - Keep logic simple and reusable
-

Widget Structure

Class: `genderSeletedbutton`

This is a **StatelessWidget** that depends on external state management.

Properties

Property	Type	Description
<code>gender</code>	<code>String</code>	The label shown on the button (e.g., Male, Female)
<code>isSelected</code>	<code>bool</code>	Controls whether the button is currently selected
<code>onTap</code>	<code>VoidCallback</code>	Callback triggered when the button is tapped

How Single Selection Works

The single-selection behavior is handled **outside the button**, using a shared variable:

```
String? selectedGender;
```

- When a button is tapped, `selectedGender` is updated
- Each button checks:

```
isSelected: selectedGender == 'Female'
```

Because only **one value** can be stored in `selectedGender`, only **one button can be selected at a time**.

Visual Behavior

Selected State

- Background color changes to `AppColors.buttonColor`
- Text color changes to white

Unselected State

- Transparent background
 - Border visible
 - Text color changes to `AppColors.c7C8493`
-

Usage Example

```
Row(  
  children: [  
    genderSeletedbutton(  
      gender: 'Female',  
      isSelected: selectedGender == 'Female',  
      onTap: () {  
        setState(() {  
          selectedGender = 'Female';  
        });  
      },  
    ),  
    UIHelper.horizontalSpaceMedium,  
    genderSeletedbutton(  
      gender: 'Male',  
      isSelected: selectedGender == 'Male',  
      onTap: () {  
        setState(() {  
          selectedGender = 'Male';  
        });  
      },  
    ),  
  ],  
)  
);
```

Key Advantages

- Clean and reusable design
- Easy to extend (add more options if needed)
- Clear separation of UI and state logic
- Works well with `setState`, Provider, Bloc, or Riverpod

Notes

- The widget name can be improved to `GenderSelectedButton` (PascalCase) for Flutter naming conventions
- Can be reused for other single-choice selections (e.g., role, status)

Summary

This button component provides a **custom, clean, and user-friendly single-selection solution** in Flutter by controlling selection state externally while keeping the UI reusable and simple.
