

Socket.IO Integration in Flutter

This document explains how to integrate Socket.IO for real-time notifications.

Dependency

```
socket_io_client: ^2.0.0
```

Connect Socket

```
IO.Socket? _socket;

void _connectSocket() {
  final token = appData.read(kKeyToken) ?? '';

  _socket = IO.io(
    "https://yourapi.com",
    IO.OptionBuilder()
      .setTransports(['websocket'])
      .setAuth({'token': token})
      .enableAutoConnect()
      .enableReconnection()
      .build(),
  );
}
```

Listen to Events

```
_socket!.on('notification', (data) {
  if (mounted) {
    setState(() {
      _hasNewNotification = data['has_new'] ?? false;
    });
  }
});
```

Full Example Widget

```
class HomeScreen extends StatefulWidget {
  @override
  State<HomeScreen> createState() => _HomeScreenState();
}

class _HomeScreenState extends State<HomeScreen> {
  IO.Socket? _socket;
  bool _hasNewNotification = false;

  @override
  void initState() {
    super.initState();
    _connectSocket();
  }

  @override
  void dispose() {
    _socket?.dispose();
    super.dispose();
  }
}
```
