

Flutter OverflowToggle Widget Documentation

Overview

`OverflowToggle` is a **custom toggle switch widget** in Flutter. It provides a **small pill-shaped background** with a **movable circular thumb** that indicates the toggle state. The toggle uses animation for smooth transitions between ON and OFF states.

This documentation is **editable** and **viewable**, making it easy to integrate, modify, or copy code.

Features

- Smooth animated toggle thumb movement
- Customizable size using `ScreenUtil`
- Configurable colors for ON and OFF states
- Tap to toggle the state
- Stateless and reusable

Constructor

```
const OverflowToggle({  
  super.key,  
  required this.value,  
  required this.onChanged,  
});
```

Parameters

Parameter	Type	Description
<code>value</code>	<code>bool</code>	Current state of the toggle (true = ON, false = OFF)
<code>onChanged</code>	<code>ValueChanged<bool></code>	Callback when toggle is tapped

Source Code

```
import 'package:flutter/material.dart';  
import 'package:flutter_screenutil/flutter_screenutil.dart';  
import 'package:isaacmwesigw352/assets_helper/app_colors.dart';
```

```

class OverflowToggle extends StatelessWidget {
  final bool value;
  final ValueChanged<bool> onChanged;

  const OverflowToggle({
    super.key,
    required this.value,
    required this.onChanged,
  });

  @override
  Widget build(BuildContext context) {
    return GestureDetector(
      onTap: () => onChanged(!value),
      child: SizedBox(
        width: 40.w,
        height: 22.h,
        child: Stack(
          alignment: Alignment.centerLeft,
          clipBehavior: Clip.none,
          children: [
            /// Background pill
            Positioned(
              left: 6.w,
              right: 6.w,
              child: Container(
                height: 10.h,
                decoration: BoxDecoration(
                  color: AppColors.c3B82F6.withAlpha(60),
                  borderRadius: BorderRadius.circular(20.r),
                ),
              ),
            ),
            /// Big circle (thumb)
            AnimatedPositioned(
              duration: const Duration(milliseconds: 220),
              curve: Curves.easeOut,
              left: value ? 20.w : 6.w,
              child: Container(
                width: 16.w,
                height: 16.w,
                decoration: BoxDecoration(
                  color: value ? AppColors.c3B82F6 : AppColors.c919191,
                  shape: BoxShape.circle,
                ),
              ),
            ),
          ],
        ),
      ),
    );
  }
}

```

```
        ),  
        1,  
    ),  
    ),  
);  
}  
}
```

Example Usage

```
OverflowToggle(  
  value: isToggled,  
  onChanged: (newValue) {  
    setState(() {  
      isToggled = newValue;  
    });  
  },  
)
```

Notes & Best Practices

- Use `ScreenUtil` for responsive sizing.
- Colors can be customized using `AppColors` or directly via `BoxDecoration`.
- Stateless widget makes it reusable and lightweight.
- Animation duration and curve can be adjusted for smoother transitions.

This widget is ideal for small settings toggles, preferences, or any binary ON/OFF UI control.
