

Linear Progressbar Documentation (Flutter)

Overview

This document explains the purpose, structure, and working mechanism of the **LinerProgressbar** Flutter widget. You can freely edit this document to customize it for your project, team, or academic submission.

1. Purpose

The `LinerProgressbar` widget is designed to guide users through a **multi-step process** such as onboarding, authentication, or setup flows.

It visually shows: - User progress - Current step - Remaining steps

2. Widget Type

- **StatefulWidget**
 - Uses internal state to track progress (`currentStep`)
-

3. State Variables

```
int currentStep = 0;  
final int totalSteps = 6;
```

- `currentStep` : Tracks the active step
 - `totalSteps` : Total number of steps in the flow
-

4. Progress Bar Implementation

Two types of progress indicators are used:

4.1 Linear Progress Bar

```
LinearProgressBar(  
  maxSteps: totalSteps,  
  currentStep: currentStep,  
  progressColor: AppColors.c4CAF50,
```

```
        backgroundColor: AppColors.cF44336,  
    )
```

4.2 Dot Progress Bar

```
LinearProgressbar(  
    progressType: LinearProgressbar.progressTypeDots,  
    currentStep: currentStep,  
    maxSteps: totalSteps,  
)
```

5. Dynamic Page Content

```
IndexedStack(  
    index: currentStep,  
    children: const [  
        SignUpScreen(),  
        LoginScreen(),  
        HomeScreen(),  
        Placeholder(),  
        Placeholder(),  
        Placeholder(),  
    ],  
)
```

Why IndexedStack?

- Preserves widget state
- Switches screens without rebuilding

6. Navigation Logic

```
onPressed: () {  
    if (currentStep < totalSteps - 1) {  
        setState(() => currentStep++);  
    }  
}
```

- Advances progress on button press
- Can trigger a final action when completed

7. Layout Structure

- Scaffold
- SafeArea
- Column
- Expanded
- BottomNavigationBar

8. Use Cases

- User onboarding
- Signup/Login flow
- Multi-step forms
- Tutorials & walkthroughs

9. Advantages

- Clean UI
- Easy to maintain
- Reusable logic
- User-friendly navigation

10. Customization Ideas (Editable)

 You can edit this section: - Change button text - Add animations - Replace placeholders - Add validation per step
